

# SDI4Apps

Uptake of Open Geographic Information Through Innovative Services Based on Linked Data

# SDI4Apps

**Full title:** Uptake of Open Geographic Information Through Innovative Services Based on Linked Data

**Duration:** 36 Months  
1<sup>st</sup> April 2014 – 31<sup>st</sup> March 2017

**Funding:** Competitiveness and Innovation FP (CIP-ICT-PSP)  
Budget 4 million EUR

**Consortium:** 19 partners

# consortium

Coordinator:  University of West Bohemia in Pilsen

-  Hyperborea s.c.
-  Asplan Viak Internet as
-  Czech Centre for Science and Society
-  Zemgale Planning Region
-  Masaryk University
-  Stichting EUROGI
-  The National Microelectronics Applications Centre Ltd
-  Baltic Open Solution Center
-  University of Maribor
-  Slovak Environmental Agency
-  ERFC
-  e-PRO Group
-  Vidzeme Planning Region

-  STEPIM
-  Uhlava
-  Help Service - Remote Sensing
-  SSSA
-  Pronatur
-  Talos

**19 partners**  
**9 European Countries**

**mobile devices**

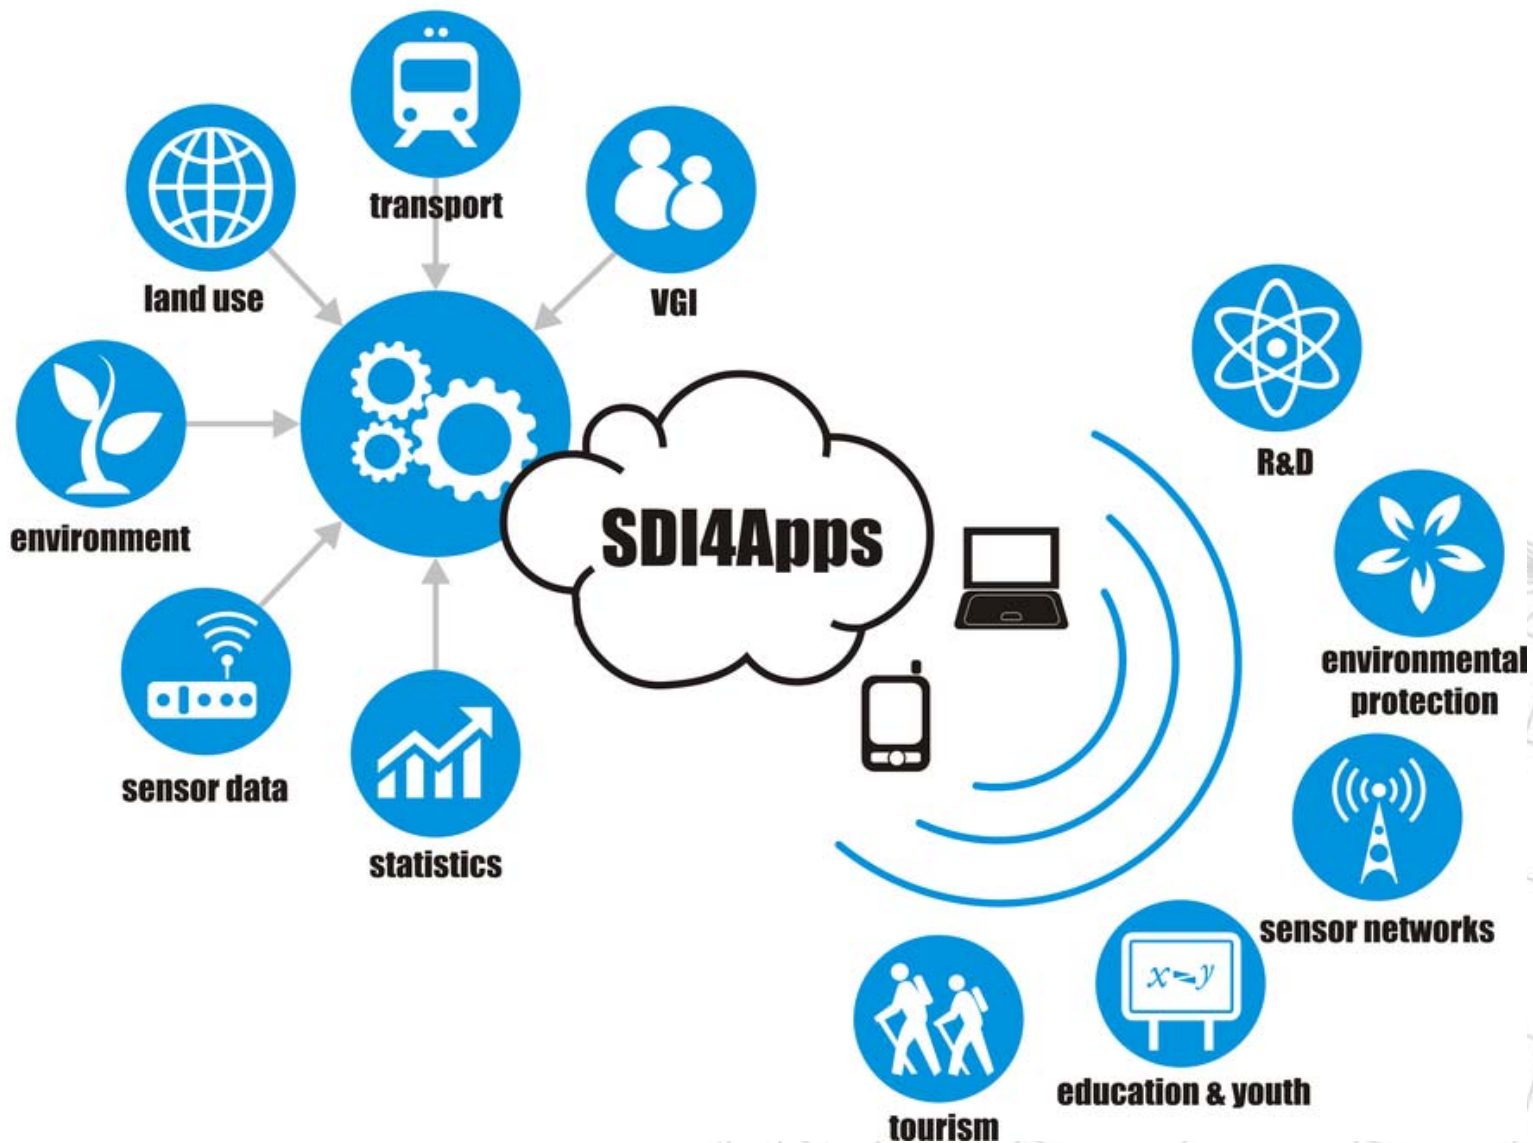

**other sensors**

....

# SDI

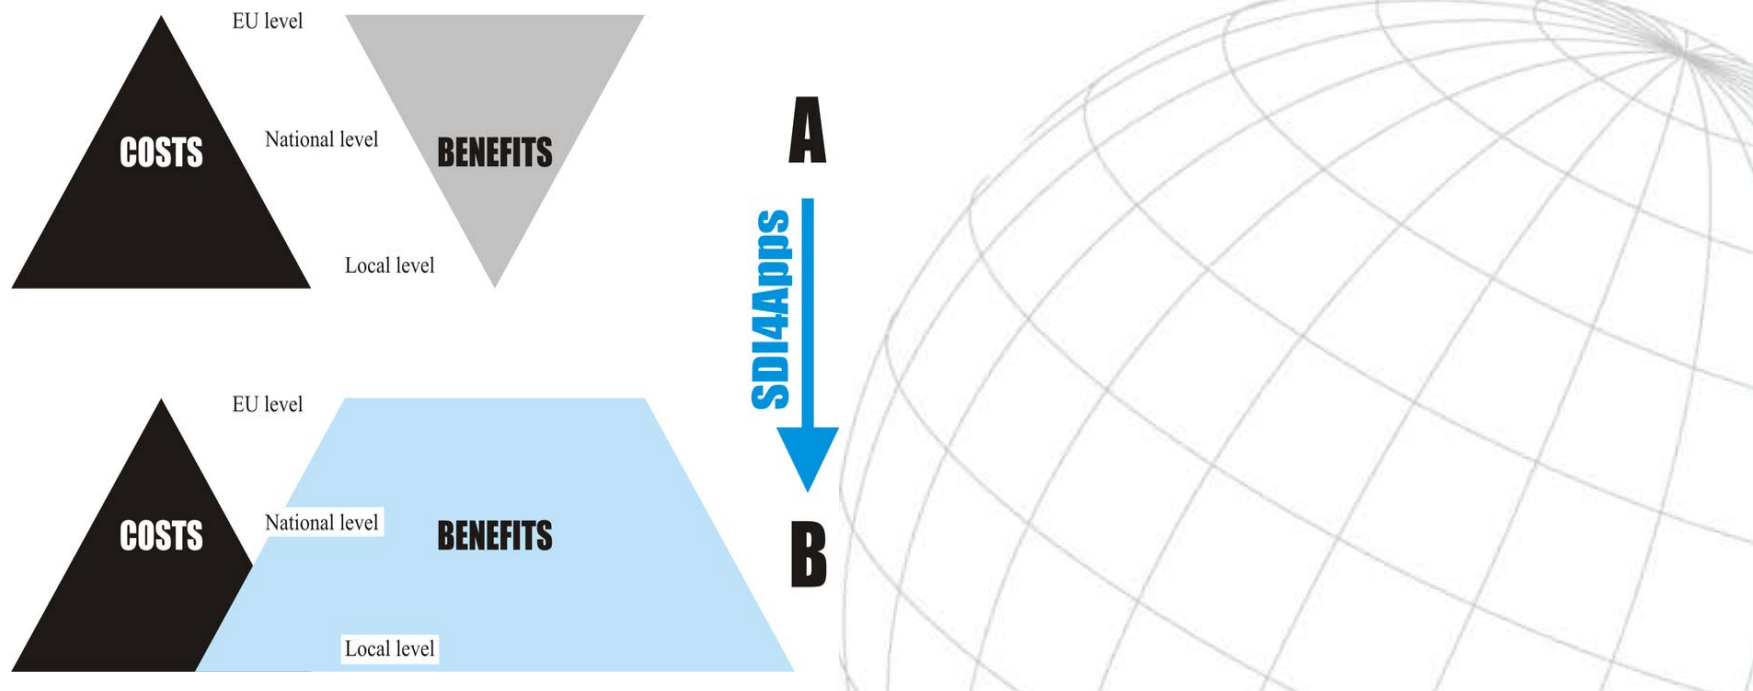

open data

## OBJECTIVES

- **SDI4Apps** will provide a solution for strengthening the benefits at national and local levels, which is vital for successful implementation of INSPIRE.
- **SDI4Apps** will demonstrate how SMEs, NGOs, regional developing agencies, municipalities and citizens can benefit from INSPIRE/Copernicus/GEOSS and how INSPIRE/Copernicus/GEOSS can profit from voluntary initiatives.

## OBJECTIVES

SDI4Apps will demonstrate:

- how neogeography and VGI principles can be combined with INSPIRE,
- how public sector can profit from voluntary initiatives, and
- how these types of applications can generate business for local SMEs.

## OBJECTIVES

SDI4Apps will demonstrate that **Cloud Computing and Open Source development can converge** by integrating open and scalable Cloud SDI using Open Source software.

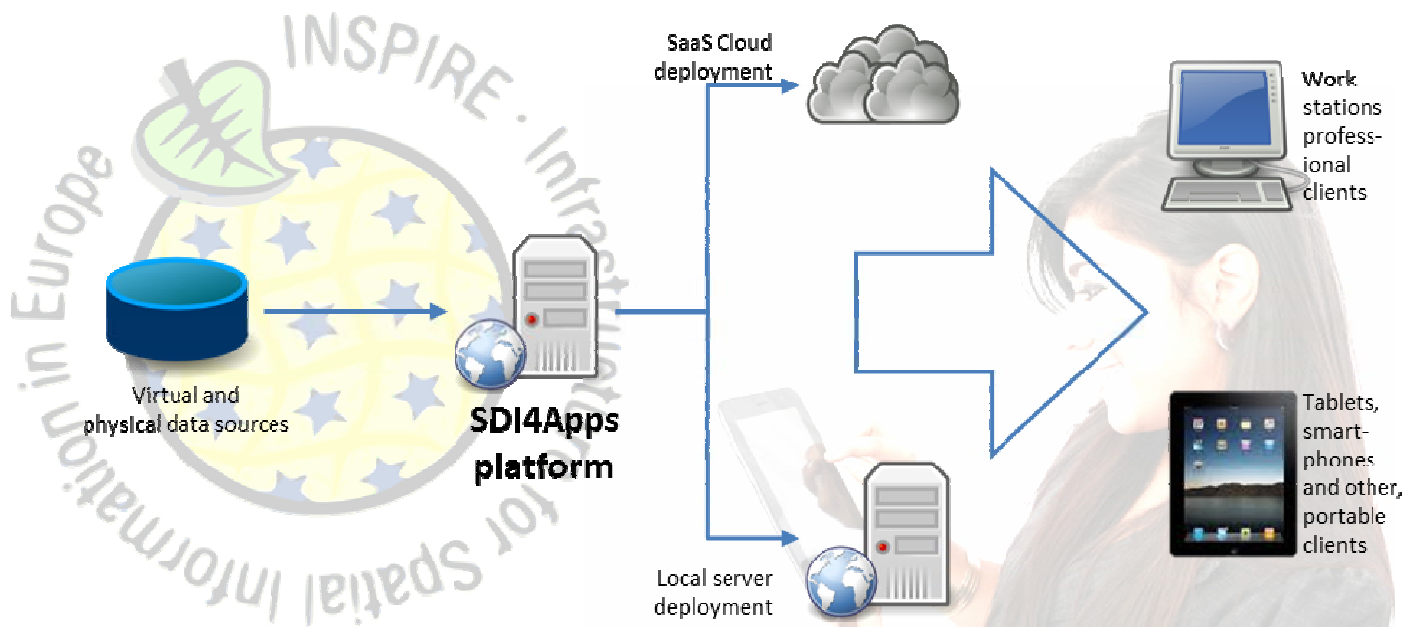

SDI4Apps will define and adapt **open API** for all SDI components to allow easy development of new apps by non-GI specialists.

## OBJECTIVES

**SDI4Apps** will build a **community around the SDI4Apps Cloud**, which will be based on core community represented by the project partners. This community will be extended by other related communities and through organising sprint code workshops and developers' contests.

### Data Layer

- Local data in GDAL/OGR readable formats
- Web data in Linked Open-Data, WMS, WFS, WCS, CS-W, GeoJSON, GeorSS and KML formats
- Sensor connectivity through SOS, SAS, SES protocols
- Caching of remotely stored data for improved performance

### Application Layer

The platform includes the following components for a complete application development platform: map server; database server; geodatabase API; inverted index (Solr), transformation; translation WMS, WFS, WCS client-server; web processing services (WPS); metadata registry; user management; payment handling; augmented reality processor; workflow engine; content management engine

### Delivery Channel

SDI4Apps may be installed on individual servers or accessed through the Cloud as Software-as-a-Service.

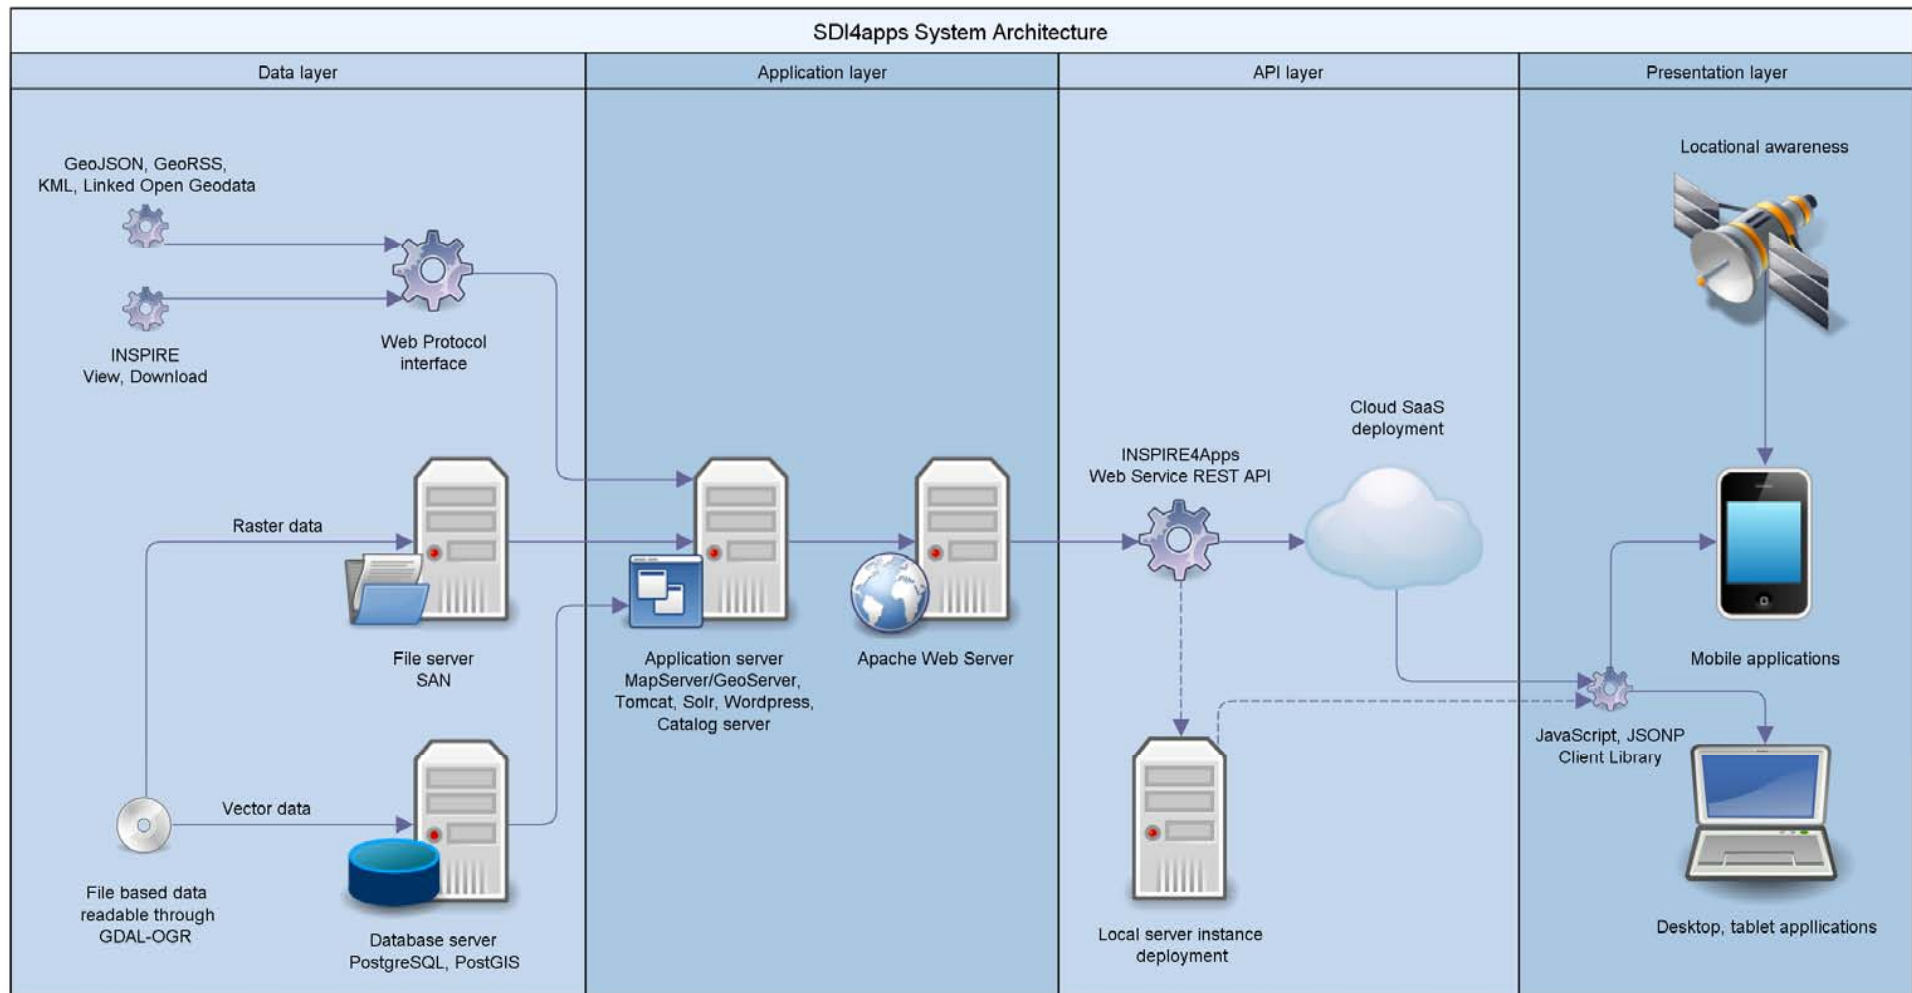

SDI4Apps Cloud implements an API that permits development of 3rd party applications built on the infrastructure.

Communication is built on open standards

### Client Layer

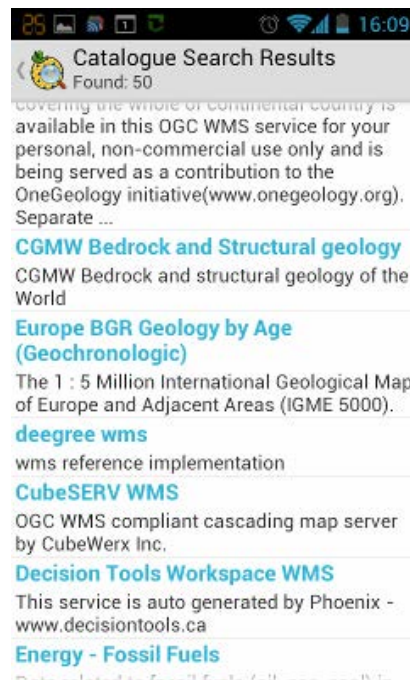

- «Traditional» web apps for desktop computers
- Mobile apps for tablets and smart phones making use of on-board sensors and capabilities such as GPS, compass, camera, microphone, speaker, social network awareness
- Making use of HTML5 and client-side JavaScript APIs for cross-platform compatibility

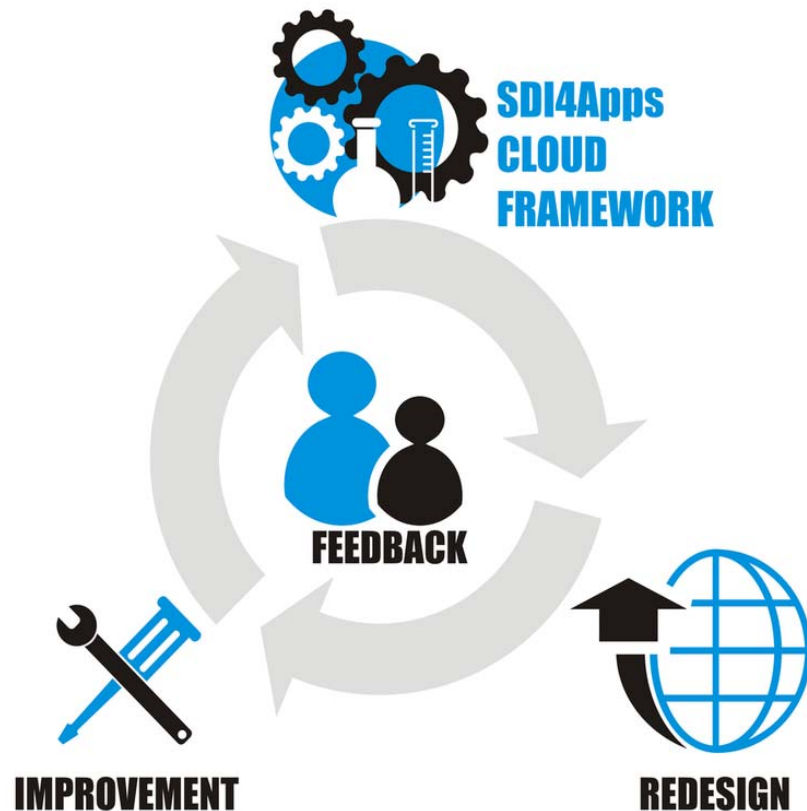

## PILOT APPLICATIONS

- PILOT I: Easy Data Access – metadata, HS-CAT
- PILOT II: Open Smart Tourist Data – including VGI
- PILOT III: Open Sensor Network
- PILOT IV: Open Land Use Map Through VGI
- PILOT V: Open INSPIRE4Youth
- PILOT VI: Ecosystem Services Evaluation (ESS Evaluation)

## **IMPLEMENTATION**

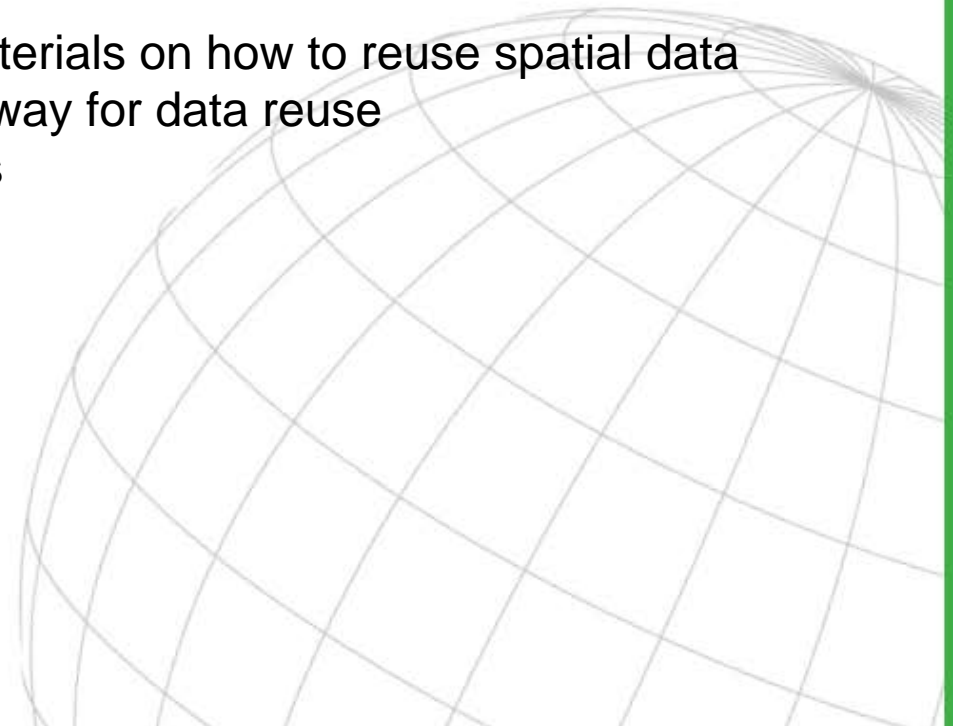

- (1) Deployment of the basic SDI4Apps Cloud Framework
- (2) Validation & Feedback
- (3) Deployment of extended functionality (language, LOD, ...)
- (4) User experimentation and social validation through pilots
- (5) Feedback to the SDI4Apss community
- (6) Redesign
- (7) Improvement of the SDI4Apps Cloud Framework
- (8) User experimentation and social validation in real-world contexts

## CORE RESULTS

- a new generation of SDI
- tools for easy access to spatial and non-spatial data
- mechanisms for linking spatial and non-spatial data
- multilingual support for spatial data
- cloud based infrastructure
- data pool of open and commercial data for further reuse
- API designed for app developers
- a set of tutorials and educational materials on how to reuse spatial data
- a set o pilot applications paving the way for data reuse
- a network of SDI4Apps stakeholders
- a sustainable business model

## EXPLOITATION

- business opportunities for developers and SMEs
- support for public authorities and other stakeholders through existing and newly created networks
- interoperable data provision for app development
